Group Explicit Methods For The Numerical Solution Of

The group explicit (GE) methods have been used successfully to solve numerical problems involving parabolic and hyperbolic partial differential equations [1, 2]. In this paper we extend the techniques discussed in Ref. 1 so that they are applicable to a system

Implicit and Explicit Processes in the Development of

Explicit Instruction is a challenge to the view of explicit instruction as an outdated, mechanistic instructional strategy and presents it as timely, proven, and accessible. The explicit instruction

Explicit Instruction: Strategies for Meaningful Direct

Explicit and implicit methods are approaches used in numerical analysis for obtaining numerical approximations to the solutions of time-dependent ordinary and partial differential equations, as is required in computer simulations of physical processes.

— Implicit methods allow for much bigger timesteps without losing stability. “ As a result, explicit methods are more efficient than implicit methods because their larger time step often makes up for the difference in solving a linear system.

An explicit solution results from a method that is independent of other values (for the same level), a single equation is used to evaluate new nodal variables for a single time step.

Implicit vs. Explicit Numerical Methods Numerical solution schemes are often referred to as being explicit or implicit. When a direct computation of the dependent variables can be made in terms of known quantities, the computation is said to be explicit.
