Definition. The work function  $W$  for a given surface is defined by the difference  $= \phi_v - \phi_m$ , where  $\phi_v$  is the charge of an electron,  $\phi_v$  is the electrostatic potential in the vacuum nearby the surface, and  $E_F$  is the Fermi level (electrochemical potential of electrons) inside the material. The term  $\phi_v e$  is the energy of an electron at rest in the vacuum nearby the surface.

Strain measurement is important in mechanical testing. A wide variety of techniques exists for measuring strain in the tensile test; namely the strain gauge, extensometer, stress and strain determined by machine crosshead motion, Geometric Moire technique, optical strain measurement techniques and others.

Length measurement is implemented in practice in many ways. The most commonly used approaches are the transit-time methods and the interferometer methods based upon the speed of light. For objects such as crystals and diffraction gratings, diffraction is used with X-rays and electron beams. Measurement techniques for three-dimensional structures very small in every dimension use specialized ...

This type of tool works well in light fly cutters that hold the tool at an angle of 10°-15° to the work. It is basically the same as a left hand turning tool without the side or end cutting edge angles.
